Product Description

ASTM 6061 Aluminium Sheet 12m Long Polished Surface Used For Decoration

6061 neutralizes the bad effects of iron; Sometimes a small amount of copper or zinc is added to improve the strength of the alloy without significantly reducing its corrosion resistance; There is a small amount of copper in the conductive material to offset the bad effect of titanium and iron on the conductivity; Zirconium or titanium can refine grain and control recrystallization structure; Lead and bismuth can be added to improve machinability. Mg₂Si is solidly dissolved in aluminum, and the alloy has the function of artificial aging hardening. The main alloying elements in 6061 aluminum alloy are magnesium and silicon, which has moderate strength, good corrosion resistance, weldability and good oxidation effect.
