Product Description

High Quality Round Aluminium Pipe Tube 1060 1100 Mill Finished For Rail Traffic

Description

An aluminum round tube is a non-ferrous, round, hollow aluminum product used in many structural applications. Aluminum round tubes are typically manufactured through extrusion, where a heated aluminum billet is forced through a shaped die to create a continuous tube length with a circular cross-section. They can also be drawn seamlessly.

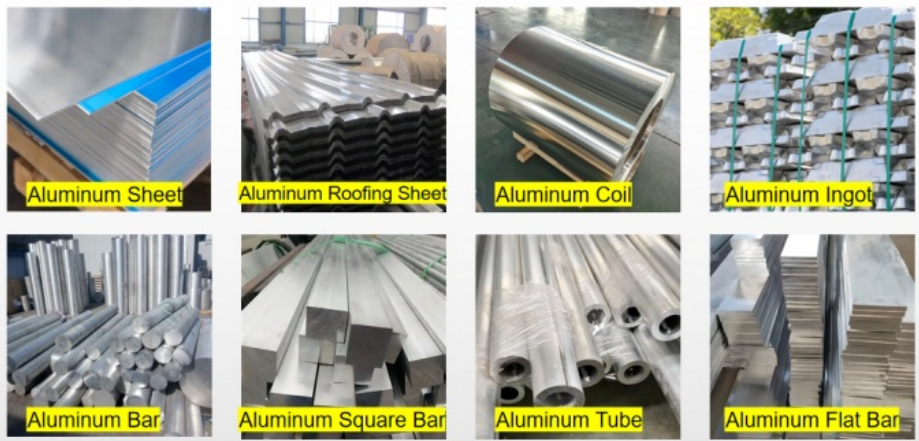

Aluminum round tubes come in a wide range of different finishes, including anodized. The interior is generally smooth with no seams. It is available in two variants: a more affordable extruded structural aluminum round tube or a more expensive drawn seamless form for those higher precision applications.
